

Issues Fixed (Bug)

1. Issue Status Filtering could return tasks of other statuses
Bug found in search-task.sql
How I discovered it?
→ I mean it was obvious the filter was not working as expected because it was returning other tasks even though you select a particular task status.

What was the root cause?

- There was no parenthesis around the two LIKE conditions. as AND binds tighter than OR

I fixed it with the VS codes AI. First I checked the req going to backend (url) through Network Tab. I checked whether the url has status that I selected

The url contained status="DONE"
so frontend was fine meaning
bug was in backend

2. The Artificial backend delay was
slowing request. It deliberately
paused before searching tasks.
It calculated a Complexity score
from the query length then slept
for that score multiplied by 100ms.
That added one second of
artificial latency for short or
empty queries.

How I found it?

By inspecting the task-search req
flow, we found the delay in
searchTask() in TaskController.java.
Even though it said: (comment)
it was for logging, it was causing
delay every request before db
search began.

How was it fixed?

Removed the complexity calculation & its interruption handling & the complexity value from the log.

3. An older search / filter request could overwrite newer results.

When the user quickly changed the search or filter, each change started a ~~new~~ new API request.

If an older request took longer & finished after the newer one its response could replace the latest results.

How did we find it

Traced the frontend task-fetching flow in UseTask.js which starts requests whenever the query, status page or page size changes. Previously it applied each response without checking whether it was still current which resulted in a race-condition

How was it fixed?

The hook now creates an AbortController for each $\&$ & aborts that request when its inputs is changed or effect is cleaned up.

4. Changing search or status while on a later page doesn't reset the page to 1. This makes valid results appear empty [App.jsx]

This was fixed in the App.jsx when the search term or status changes the app.jsx now resets the page to 1.

For this bug I used the VS code copilot to solve
